Project: Diamond Prices

Step 1: Understanding the Model

Answer the following questions:

1. According to the linear model provided, if a diamond is 1 carat heavier than another with the same cut and clarity, how much more should we expect to pay? Why?

   *The given linear model is **Price = -5269 + 8413 x Carat + 158.1 x Cut + 454 x Clarity.** If a diamond is taken which is 1 carat heavier than another diamond with same cut and clarity, then according to the above linear model, we should expect to **$8413** more.*

2. If you were interested in a 1.5 carat diamond with a **Very Good** cut (represented by a 3 in the model) and a **VS2** clarity rating (represented by a 5 in the model), how much would the model predict you should pay for it?

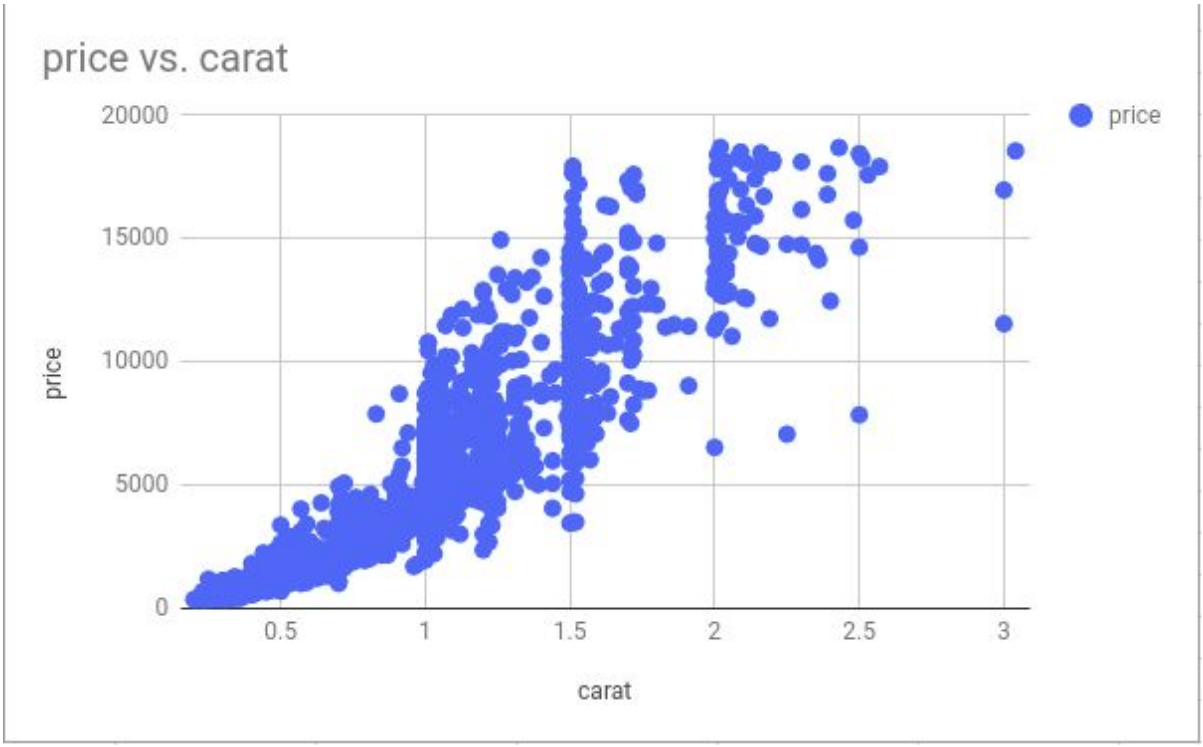
   *The model has predicted to pay **$10,094.8***

Step 2: Visualize the Data

Make sure to plot and include the visualizations in this report. For example, you can create graphs in Excel and copy and paste the graphs into this Word document.

1. Plot 1 - Plot the data for the diamonds in the database, with carat on the x-axis and price on the y-axis.

2. Plot 2 - Plot the data for the diamonds for which you are predicting prices with carat on the x-axis and predicted price on the y-axis.
    - **Note**: You can also plot both sets of data on the same chart in different colors.



3. What strikes you about this comparison? After seeing this plot, do you feel confident in the model's ability to predict prices?

   The new diamonds dataset has a strong positive correlation between price and carat. But for some cases the price is negative which indicates that it is not a good idea to use linear regression model for finding prices.

   The old diamond prices and carat did not have a strong correlation. There are other factors like cut and clarity which affects the price of diamonds.

Step 3: Make a Recommendation

Answer the following questions:

1. What price do you recommend the jewelry company to bid? Please explain how you arrived at that number. HINT: The number should be 7 digits.

   Summing up all the predicted prices and taking 70% of it gives the price ***$8213465.***
